

Year 1/2 Talk for Writing Text

Autumn 1: Information Text

Animals have different adaptations to help them survive in their habitats.

Camels

Camels live in the scorching desert. They have big feet to help them walk on the sand. Did you know they have two rows of eyelashes which keep out the sand?

Elephants

Elephants need to keep cool in the roasting sun. They can flap their big ears to make a breeze. They have lots of skin so there is a larger area for the heat to escape.

Polar Bears

Polar bears live in the freezing Arctic. They need to keep warm because it gets very cold. They have white fur so that they can blend into the snow. This means they can sneak up on their prey. Surprisingly, they look white but their skin is black to absorb the heat.
